

Dear [Patient],

Congratulations. Requesting information about a breakthrough treatment for hepatitis C (Hep C) genotype 1, the most common type in the United States, could be the first step in putting the uncertainties of Hep C behind you.

HARVONI is a prescription medicine for chronic (lasting a long time) Hep C genotype 1 in adults that combines two drugs (ledipasvir and sofosbuvir). It is not known if HARVONI is safe and effective in children under 18 years of age.

What makes HARVONI a breakthrough treatment?

- It's the one and only cure that's **one pill, once a day**.
- With HARVONI, there's **no interferon, no ribavirin, and no complicated regimens**.

HARVONI has been proven to cure 96–99% of adult patients who've had no prior Hep C treatment with 12 weeks of therapy.*

*In a study of 865 patients with genotype 1 Hep C and no prior Hep C treatment, with or without advanced liver disease (cirrhosis), 99% (210 out of 213) of those who received HARVONI once daily for 12 weeks were cured. In a separate study of 647 patients with genotype 1 Hep C, with no prior Hep C treatment and without cirrhosis, 96% (208 out of 216) of those who received HARVONI once daily for 12 weeks were cured.

What does it mean to be cured? It's when the Hep C virus can **no longer be detected** in your blood when measured three months after you've finished your treatment.

What should I tell my healthcare provider before taking HARVONI?

- If you have: liver problems other than hepatitis C infection; severe kidney problems or are on dialysis; any other medical condition; or if you are pregnant or breastfeeding or plan to become pregnant or breastfeed. It is not known if HARVONI will harm your unborn baby or pass into your breast milk.
- If you take amiodarone (Cordarone®, Nexterone®, Pacerone®), rifampin (Rifadin®, Rifamate®, Rifater®), St. John's wort or a product that contains St. John's wort. Tell your healthcare provider about all the medicines you take, including prescription and over-the-counter medicines, vitamins, and herbal supplements. HARVONI may affect the way other medicines work, and other medicines may affect how HARVONI works.

You should not take HARVONI if you also take other medicines that contain sofosbuvir (SOVALDI®).

What are the most common side effects of HARVONI?

Common side effects include tiredness and headache.

Please see full Prescribing Information, including Patient Information, inside brochure pocket.

Take the next step. Talk to your Hep C specialist about HARVONI.

Read the enclosed brochure for more information about HARVONI. Then make an appointment to see your Hep C specialist. He or she can determine if HARVONI is right for you.

Just think. This next step could be a step closer to a cure.

Sincerely,
Your HARVONI Team

P.S. Please see the checklist on page 16 of the enclosed brochure to help start a conversation with your Hep C specialist.
