

Get closer to a cure with **no interferon** and **no ribavirin**.

Cure means the hepatitis C (Hep C) virus is not detected in the blood when measured 3 months after treatment is completed.

A significant advancement in chronic Hep C genotype 1 treatment.

If you or someone you care about have experienced or heard of past Hep C treatments that were difficult to tolerate, you should know about **HARVONI—a different kind of treatment regimen**.

HARVONI, a prescription medicine containing ledipasvir and sofosbuvir, is used to treat chronic (lasting a long time) Hep C genotype 1 infection in adults. It is not known if HARVONI is safe and effective in children under 18 years of age.

Think about it.

HARVONI lets you treat your Hep C with **no interferon, no ribavirin**, and **no complicated treatment regimens**. What could that mean for you?

Important Safety Information

What should I tell my healthcare provider before taking HARVONI?

- If you have: liver problems other than hepatitis C infection; severe kidney problems or are on dialysis; any other medical condition; or if you are pregnant or breastfeeding or plan to become pregnant or breastfeed. It is not known if HARVONI will harm your unborn baby or pass into your breast milk.
- If you take amiodarone (Cordarone®, Nexterone®, Pacerone®), rifampin (Rifadin®, Rifamate®, Rifater®), St. John's wort or a product that contains St. John's wort. Tell your healthcare provider about all the medicines you take, including prescription and over-the-counter medicines, vitamins, and herbal supplements. HARVONI may affect the way other medicines work, and other medicines may affect how HARVONI works.

You should not take HARVONI if you also take other medicines that contain sofosbuvir (SOVALDI®).

What are the most common side effects of HARVONI?

Common side effects include tiredness and headache.

No interferon.

Interferon is an injectable medicine (a shot) that can be used to treat Hep C. Among other side effects, it can cause flu-like symptoms, such as headache, fever, chills, tiredness, muscle aches, and joint pain.

No ribavirin.

Ribavirin is an anti-viral therapy that has been used to treat Hep C in combination with other medications. No ribavirin means there is no need to take multiple pills per day as part of your Hep C treatment, and it reduces the risk of developing anemia (decrease in red blood cells).*

*In clinical studies anemia was seen in under 1% (5 out of 1080) of patients who took HARVONI alone versus 10% (85 out of 872) of patients who took a combination of HARVONI and ribavirin.

HARVONI is one pill, once a day, that's been proven to cure 96–99% of patients who've had no prior Hep C treatment with 12 weeks of therapy.[†] Cure means **the Hep C virus is not detected** in the blood when measured 3 months after treatment is completed.

[†]In a study of 865 patients with genotype 1 Hep C and no prior Hep C treatment, with or without advanced liver disease (cirrhosis), 99% (210 out of 213) of those who received HARVONI once daily for 12 weeks were cured. In a separate study of 647 patients with genotype 1 Hep C, with no prior Hep C treatment and without cirrhosis, 96% (208 out of 216) of those who received HARVONI once daily for 12 weeks were cured.

ASK YOUR HEP C SPECIALIST IF HARVONI
IS RIGHT FOR YOU.
